

# Go-to-market executive summary, in five layers

aimez strategy summary June 2026

Each layer stands alone in conversation. Start at whichever layer the listener cares about; the layers below are the support.

## Layer 1: Product

A measured decision surface for pedestrian movement in Manhattan. A street graph where every block carries validated layers (street pressure, tree canopy, surface heat) and an engine that returns five comparable routes with per-block statistics and confidence in one call. Consumers see routes; the asset is the surface underneath, which knows where people walk and how each block feels. Proof: the Grand Central to Carnegie Hall case (`fig_case_gc_carnegie`).

## Layer 2: Moat

The validation and provenance discipline, not the routing code. Every layer carries a manifest with input hashes; every claim has an allowed and not-allowed list; audits are cheap enough to run the same morning a doubt is raised. Live proof this week: a tree-level audit caught the canopy layer crediting side-street trees to avenue corners, withdrew a published claim and replaced the mechanism within one day (`fig_case_upwind`). A competitor can re-weight public data; they cannot shortcut the discipline that catches that class of error.

## Layer 3: Beachhead, out-of-home advertising

OOH sells foot-traffic exposure as its entire currency and buys data products rather than apps. The offer: a comfort-weighted exposure index per panel location with a confidence score and a provenance trail. Incumbent counts say how many; the surface explains why a block draws or repels walkers and how long they linger. Pilot: one corridor, one metric, one media owner, success defined as the index reordering inventory in a way the current data missed. Mechanics proof: the Village dog-park case (`fig_case_village`), flip threshold about 11 DBH-inches per 100 m.

## Layer 4: Adjacent markets

In priority order behind the beachhead: outdoor-workforce heat compliance under tightening occupational rules, municipal resilience and transportation offices that buy static heat reports today, real estate walkability indices, last-mile logistics routing. Each reuses the same surface with a different cost weighting; none needs a consumer user base.

## Layer 5: Motion and asks

Motion: paid pilot study, then a per-market annual data license. Land one media owner, expand to brand-side buyers. Research leg: NSF SBIR Phase I pitch submitted. Asks in order: go-to-market judgment, adjacent paid work near decision systems, a milestone-gated investor look after the pitch lands and a pilot signs.

## Layer summary

| Layer     | The one line                                    | Proof point                     |
|-----------|-------------------------------------------------|---------------------------------|
| Product   | A measured decision surface for foot traffic    | GC to Carnegie case             |
| Moat      | Validation and provenance, not the routing code | The canopy audit catch          |
| Beachhead | A comfort-weighted exposure index for OOH       | The Village dog-park case       |
| Adjacent  | Same surface, different cost weighting          | Compliance, cities, real estate |
| Motion    | Paid pilot then license; three layered asks     | NSF pitch submitted             |

## Honest caveats

OOH measurement is standards-driven, so an independent index has to be benchmarked before owners adopt it. Comfort-to-dwell is a hypothesis the first pilot exists to test. Mobile-location panels out-scale us, so the pitch stays on explanatory quality rather than raw coverage. All heat readings are surface temperature until street-level measurement exists.
